ABSTRACT

This project focuses on the design and development of a Web-Based Payroll and Leave Management System with RFID Attendance for Saketha Enterprises; a distribution company located in Kurunegala. The organization currently relies on manual or outdated computerized systems for managing employee attendance, leave requests, and salary calculations. These traditional methods are time-consuming, prone to human error, and inefficient for managing employee-related information.

The main objective of the proposed system is to automate and streamline employee attendance tracking, leave request management, and payroll processing through a centralized web-based application. The system integrates RFID technology to automatically record employee attendance through card tapping, ensuring accurate check-in and check-out records. Additionally, employees can submit leave requests online, while administrators can review, approve, or reject requests through an administrative dashboard.

The system also includes an automated payroll module that calculates employee salaries based on attendance records and predefined payment rules. Managers are able to view attendance logs, employee details, payroll summaries, and leave requests in real time.

The system was developed using html, css, javascript, php, and mysql, providing a user-friendly and accessible web interface. The implementation of this system improves operational efficiency, reduces administrative workload, enhances data accuracy, and provides better management control over employee-related operations.

KEYWORDS

- Database Management

ACKNOWLEDGEMENT

First and foremost, we would like to express our sincere gratitude to our supervisor Ms. Inoka Abeysinghe for her continuous guidance, valuable advice, and encouragement throughout the development of this project. We would like to extend our heartfelt gratitude to everyone who contributed to the successful completion of the Payroll and Leave Management System for Saketha Enterprises, whether directly or indirectly.

We would also like to thank the National Institute of Business Management (NIBM), School of Computing and Engineering, for providing us with the knowledge and technical foundation necessary to complete this project successfully.

We are grateful to the management and employees of Saketha Enterprises for their collaboration, provision of necessary materials, and willingness to share their insights regarding their distribution operations and salary structures, all of which were crucial to the success of our project. Additionally, we would like to thank our friends and family for their unwavering support, understanding, and encouragement during this academic journey.

Finally, we wish to acknowledge and express our gratitude to all the individuals, groups, and resources that played a role in helping us complete this project, whether directly or indirectly.

CHAPTER 1 - INTRODUCTION

1.1 Introduction of the Organization

Saketha Enterprises is a distribution company located in Kurunegala that operates as a distributor for various consumer products. The company supplies products to a wide network of retailers, supermarkets, and small vendors in the surrounding regions. The organization manages several operational activities including product distribution, order management, inventory handling, and employee management.

The company employs several staff members including managers, warehouse assistants, drivers, helpers, and sales representatives. These employees are responsible for performing daily operational tasks such as receiving goods, delivering products, handling orders, and maintaining records related to company operations.

Efficient employee management plays a significant role in ensuring the smooth functioning of the organization. Proper tracking of employee attendance, leave requests, and salary calculations is essential for maintaining accurate records and ensuring fair payroll management.

However, Saketha Enterprises currently relies on manual and outdated systems to manage employee information and payroll records. This creates several operational challenges including inaccurate records, time-consuming administrative tasks, and difficulties in tracking employee attendance.

To overcome these challenges, the organization requires a modern computerized system capable of managing employee attendance, leave requests, and payroll calculations efficiently.

1.2 Organization Structure

Figure 1 - Organization Structure

The organizational structure of Saketha Enterprises follows a hierarchical structure where the Owner is positioned at the top level and is responsible for overall business operations and decision making.

The Manager reports directly to the owner and supervises the daily operational activities of the organization. The manager oversees warehouse operations, employee management, and distribution activities.

The Warehouse Assistant is responsible for supervising stock handling operations and coordinating warehouse staff. Workers such as drivers and helpers assist in product delivery and warehouse activities.

The Sales Representatives are responsible for processing orders, maintaining relationships with retailers, and managing sales activities.

Each employee plays an important role in ensuring that the company's operations run smoothly and efficiently.

1.3 Current Operations in the Organization

Currently, the organization uses a combination of manual record keeping and outdated computerized systems to manage employee attendance and payroll activities.

Employee attendance is often recorded manually using logbooks or registers. This method makes it difficult to accurately track employee working hours and increases the possibility of human errors.

Leave management is also handled manually, where employees submit leave requests through paper forms. Managers then manually review and approve or reject these requests. This process is time consuming and often results in delays.

Salary calculations are performed manually based on attendance records and working days. Since attendance records are not properly automated, the payroll calculation process is prone to mistakes and inconsistencies.

Additionally, the lack of a centralized database makes it difficult for management to retrieve employee records, attendance logs, and payroll information quickly.

1.4 Users and Responsibilities

The proposed system will be used by several types of users within the organization.

❖ Owner:

- Provides overall leadership and sets company strategies.
- Reviews complete financial and sales performance reports

❖ Manager:

- Supervise daily operations in warehouse and sales.
- Approves key system actions, manages user accounts, and supervises inventory checks
- Verifying stock counts, generating pick lists

❖ Warehouse Assistant:

- Directly supervises all inventory related operations.

- Responsible for ensuring accurate input of stock receipts, managing stock transfers, and approving stock changes(e.g: for damaged goods).
- Confirming stock loading/unloading
- Check, review and generate sales summary.
- ❖ Sales Representatives (Company):
 - Responsible for generating sales and processing orders.
 - Their primary system role is to enter new orders, check real-time stock availability, and track the status of their orders.
- ❖ Drivers:
 - Responsible for delivering products to retailers
 - Confirm order collection and successful delivery completion.
- ❖ Helpers:
 - Assist with the physical handling of stock under the supervision of the Manager and Warehouse assistant.
 - Support the non systematic, manual tasks of the process.
 -

1.5 Problem Definition

The existing system used by Saketha Enterprises suffers from several limitations.

First, the manual attendance tracking process is inefficient and unreliable. Since employees record attendance manually, there is a high possibility of incorrect entries or manipulation of records.

Second, leave management is handled using manual forms which makes it difficult to track leave history and approval status.

Third, payroll calculations are performed manually, which increases the risk of errors and requires significant time and effort from management.

Furthermore, the absence of a centralized computerized system prevents management from easily accessing employee information and attendance records.

Due to these limitations, the organization requires a modern system capable of automating employee management processes.

1.6 Project Objectives

The main objectives of the project are:

- To develop a web-based employee payroll and leave management system.
- To implement an RFID-based attendance tracking mechanism.
- To automate employee attendance recording.
- To allow employees to submit leave requests digitally.
- To provide administrators with the ability to approve or reject leave requests.
- To automate payroll calculations based on attendance data.
- To provide real-time reporting and monitoring through an administrative dashboard.
- To improve operational efficiency and reduce manual errors.

1.7 Proposed Solution

The proposed solution is a Web-Based Payroll and Leave Management System with RFID Attendance designed specifically for Saketha Enterprises.

The system will allow employees to record attendance using RFID cards by tapping them on a scanner. The system automatically records check-in and check-out times in a centralized database.

Employees can submit leave requests through the system interface, while administrators can review and approve or reject these requests.

The system also includes an automated payroll module that calculates employee salaries based on attendance records and predefined salary rules.

Administrators can access a dashboard that displays employee statistics, attendance logs, and pending leave requests.

This system improves efficiency, accuracy, and transparency in employee management.

1.8 Chapter Summary

This chapter introduced the organization, described its structure and current operations, and identified the key problems associated with the existing system. It also explained the objectives of

the project and introduced the proposed web-based payroll and leave management system designed to improve operational efficiency.

CHAPTER 2 - METHODOLOGY

2.1 Introduction

This chapter describes the methodology used to design and develop the Web-Based Payroll and Leave Management System with RFID Attendance for Saketha Enterprises. The methodology outlines the processes followed during system development, including data collection techniques, the software development model used, tools utilized for implementation, and testing strategies applied to ensure system reliability.

The project was carried out through a systematic approach beginning with requirement gathering, followed by system design, implementation, and testing. Each stage was carefully planned to ensure that the final solution meets the operational requirements of the organization.

2.2 Data Collection Methods

Several data collection techniques were used to understand the existing system and identify the requirements for the proposed solution.

Interviews

Interviews were conducted with key staff members of Saketha Enterprises including the manager and employees. These discussions helped identify the problems faced in the current attendance tracking, leave management, and payroll calculation processes.

Observation

Direct observation of daily activities was carried out to understand how employee attendance and leave management were currently handled. This helped identify inefficiencies in the manual processes used by the organization.

Document Review

Existing records such as attendance registers and leave forms were examined to understand the current method of data recording and payroll calculation.

Online Research

Research was conducted on modern employee management systems, payroll systems, and RFID attendance systems to identify best practices and useful system features.

2.3 Software Process Model

Figure 2 - Waterfall Model

The Waterfall Model was selected as the software development model for this project.

The Waterfall Model is a structured and sequential approach to system development where each stage must be completed before the next stage begins.

The stages of the Waterfall Model used in this project are:

Requirement Analysis

In this stage, system requirements were gathered through interviews, observations, and document reviews. The problems in the current system were identified and the requirements for the proposed system were defined.

System Design

The system architecture, database structure, and user interfaces were designed during this stage. UML diagrams and ER diagrams were created to represent the system structure.

Implementation

During this stage, the system was developed using programming languages and database technologies. The coding of the system modules was carried out.

Testing

The developed system was tested to identify errors and ensure that all functionalities work correctly.

Deployment

The completed system is installed and made available for use by the organization.

Maintenance

Future improvements and updates may be performed to enhance system performance and functionality.

2.4 Software Development Tools

Several technologies and tools were used during the development of the system.

HTML

HTML was used to create the structure of web pages including forms, dashboards, and user interfaces.

CSS

CSS was used to design the visual appearance of the system and improve user interface layout.

JavaScript

JavaScript was used to provide interactivity and dynamic features within the web application.

PHP

PHP was used as the server-side programming language to process user requests, handle business logic, and communicate with the database.

MySQL

MySQL was used as the database management system to store employee records, attendance logs, leave requests, and payroll information.

Bootstrap

Bootstrap was used as a front-end framework to design responsive and user-friendly interfaces.

2.5 Testing Strategies

Testing is an important part of the system development process. Several testing strategies were used to ensure the system works correctly and meets user requirements.

Unit Testing

Individual modules such as employee registration, attendance recording, and leave submission were tested separately to ensure they function correctly.

Integration Testing

Integration testing was performed to ensure that different modules of the system work together properly. For example, attendance data was verified to ensure it correctly updates payroll calculations.

System Testing

System testing was conducted to evaluate the complete system as a whole. This ensured that all modules function correctly when integrated.

User Acceptance Testing (UAT)

User Acceptance Testing was conducted with potential system users to verify that the system meets organizational requirements and is easy to use.

2.6 Implementation Plan

The implementation of the project followed a structured development schedule.

Project activities included:

- Project proposal preparation
- Requirement analysis
- System design
- Database development
- System programming
- System testing
- Project implementation
- Final report preparation
- Final project presentation

These activities were carried out according to the planned timeline to ensure the project was completed successfully.

Table 1-Implementation plan

3.2 System Architecture

The Payroll and Leave Management System follows a three-tier architecture consisting of the presentation layer, application layer, and database layer. This architecture helps separate the user interface, business logic, and data storage functions of the system.

Figure 3-3 Tier Architecture

3.3 UML Design

3.3.1 Use Case Diagram

The Use Case Diagram illustrates the interaction between the users and the Payroll and Leave Management System. It shows the main actors, Administrator and Employee, and the actions they can perform within the system.

Figure 4-Use Case Diagram

3.3.2 Class Diagram

The Class Diagram illustrates the structure of the system by showing classes, their attributes, and relationships. It represents system components such as Employee, Attendance, LeaveRequest, and Payroll.

Figure 5=Class Diagram

3.3.3 Sequence Diagram

The Sequence Diagram shows the sequence of interactions between system components during a process. It illustrates how messages flow between the user, system interface, application logic, and database.

Figure 6=Sequence Diagram

3.3.4 ER Diagram

The Entity Relationship (ER) Diagram represents the database structure of the system. It shows the entities such as Employees, Attendance, and Leave Requests and the relationships between them.

Figure 7-ER Diagram

3.3.5 Context Diagram

The Context Diagram provides a high-level overview of the system and its interaction with external entities. It shows how the Administrator and Employee communicate with the Payroll and Leave Management System.

Figure 8-Context Diagram

3.3.6 Level -1 DFD Diagram

The Level 1 Data Flow Diagram breaks down the main system into smaller processes and shows how data flows between processes and the database. It illustrates functions such as employee management, leave management, attendance tracking, and payroll processing.

Figure 9-Level 1 DFD

3.4 Chapter Summary

This chapter presented the system analysis of the proposed Payroll and Leave Management System. It explained how the system is structured and how different components interact to perform various functions and described the system architecture, database design, and various diagrams including UML, ER, and DFD. These models helped to clearly understand the system structure, data flow, and user interactions. Overall, this analysis provides a strong foundation for the system design and implementation stages.

CHAPTER 4 – SOLUTION DESIGN

4.1 Introduction

The solution design phase focuses on defining how the proposed system will be structured and developed to meet the identified requirements. It provides a detailed blueprint of the system by describing its components, interfaces, and data structures, which guide the implementation process.

In this project, the solution design of the Web-Based Payroll and Leave Management System with RFID Attendance is developed to support key functionalities such as user authentication, employee registration, RFID-based attendance tracking, leave management, payroll processing, and administrative monitoring.

This chapter presents the design of the system through several key components. The interface design illustrates the layout and functionality of user interfaces such as the login page, admin dashboard, employee portal, and other system modules. Each interface is designed to be user-friendly and efficient, supporting smooth interaction between users and the system.

The database design defines the structure of data storage, including tables such as employees, attendance, leave requests, and payroll. These tables are designed to ensure data accuracy, consistency, and efficient retrieval of information required for system operations.

In addition, the report layout design describes how system outputs such as payroll reports and attendance logs are presented to users in a clear and organized format.

Overall, the solution design provides a clear and structured representation of the system, ensuring that all components are properly defined and aligned with the implementation of the system.

4.2 Interface Design

4.2.1 Login System

The login module allows both administrators and employees to access the system securely.

Users must enter their username and password to access the system. The system checks the entered credentials against the records stored in the database. If the credentials match, the user is redirected to the appropriate dashboard based on their role.

The administrator has full access to system functions such as employee management, leave approval, and payroll generation. Employees can log into their personal portal to view attendance information and submit leave requests.

entered password

 IF user EXISTS THEN

 IF user.role = "Admin" THEN

 REDIRECT to Admin Dashboard

 ELSE

 REDIRECT to Employee Dashboard

 END IF

 ELSE

DISPLAY "Invalid Username or Password"

END IF

END IF

END

4.2.2 Employee Registration Module

The employee registration module allows the administrator to add new employees to the system.

During registration, the administrator enters the employee's details including:

- Employee ID
- Full name
- Job role
- Basic salary
- RFID tag number
- Username and password

The employee information is then stored in the employees table of the database. This information is later used for payroll calculations and attendance tracking.

The screenshot displays a web form titled "New Employee Registration" with the subtitle "Assign personal details and RFID credentials". The form is organized into several sections:

- Employee ID (Manual Assignment):** A text input field containing "e.g., EMP-001" with a red border. Below it, a note states: "Ensure this ID is unique in your system."
- Full Name:** Two identical text input fields, both containing "John Perera".
- Job Role:** A dropdown menu currently set to "Manager".
- Basic Salary (LKR):** A text input field containing "0.00".
- Assign RFID Tag Number:** A section with a blue header and a text input field labeled "Type or Scan 10-digit RFID Code". A note below reads: "You can manually type the number printed on the card or use a scanner."
- Portal Username:** A text input field containing "admin".
- Initial Password:** A text input field with masked characters "....".

At the bottom of the form, there is a prominent blue button labeled "Register Employee" with a checkmark icon, and a smaller link labeled "Back to Dashboard".

Figure 11-4.2.2-Employee Registration

END IF

END

4.2.3 RFID Attendance Module

The attendance module records employee working hours using RFID technology.

Each employee is assigned a unique RFID tag during registration. When the employee taps the RFID card on the scanner, the system records the check-in or check-out time automatically.

If the employee taps the RFID card for the first time during the day, the system records a check-in time. When the employee taps the card again, the system records the check-out time.

This automated attendance system improves accuracy and prevents manual attendance errors.

Figure 13- 4.2.3 -RFID Attendance Model

Pseudo Code

BEGIN

DISPLAY "RFID Attendance Scanner"

INPUT rfidTag

SEARCH employee FROM employees table WHERE rfid_tag = entered rfidTag

IF employee EXISTS THEN

        SAVE current time AS checkOut
        DISPLAY "Check-out recorded successfully"
    END IF
ELSE
    DISPLAY "RFID card not recognized"
END IF
END
```

4.2.4 Employee Portal Implementation

The employee portal allows employees to view their personal information and interact with the system.

After logging into the system, employees can:

- View their attendance records
- Check the number of days worked
- View approved leave requests
- Submit new leave requests

The employee dashboard displays important information such as attendance statistics and leave request status.

```

4.2.5 Leave Management Module

The leave management module allows employees to submit leave requests through the system.

Employees can select the type of leave and provide the reason for the request. Once the request is submitted, it is stored in the database with a Pending status.

4.2.5.1 Employee Leave Dashboard

The dashboard features a blue header with the user's name 'Welcome, Dinesh Udayakumara' and a 'Logout' button. Below the header, there are two large colored boxes: a green one showing 'DAYS PRESENT THIS MONTH' with the value '2', and a cyan one showing 'APPROVED LEAVES' with the value '1'. A white box displays 'Your Last Punch-In' as 'Verified at: March 16, 2026, 1:37 pm'. The main content area is divided into two sections. The left section, titled 'Request Leave', contains a form with a 'Leave Type' dropdown (currently set to 'Casual Leave'), a 'Date' field (placeholder 'yyyy-mm-dd'), a 'Reason' text area, and a 'Submit Request' button. The right section, titled 'My Recent Requests', contains a table with columns 'Date', 'Type', and 'Status'.

Date	Type	Status
2026-03-18	Casual	Pending
2026-03-17	Medical	Pending
2026-02-27	Casual	Approved

END

The administrator can review the leave request and either approve or reject it. Once the decision is made, the leave status is updated accordingly in the system.

4.2.5.2 Admin Leave Dashboard

Pending Leave Requests					
Employee ID	Type	Date	Reason	Status	Action
016	Casual	2026-03-18	Sick	Pending	<button>Approve</button> <button>Reject</button>
016	Medical	2026-03-17	Sick	Pending	<button>Approve</button> <button>Reject</button>
001	Short	2026-03-17	Personal	Pending	<button>Approve</button> <button>Reject</button>

END

4.2.6 Payroll Management Module

The payroll module automatically calculates employee salaries based on attendance records and employee roles.

The system categorizes employees into three types:

- Workers – paid daily
- Drivers – paid weekly
- Office staff – paid monthly

For workers and drivers, the system calculates salary based on attendance records captured through the RFID system. Employees who work more than four hours receive full daily payment, while those who work fewer hours receive half payment. For office staff, the system uses the registered monthly salary stored in the database. The payroll module generates a summary report that displays employee names, roles, days worked, and total salary.

Payroll Summary			
Automated calculation for Saketha Enterprises workforce			
		Print Report	Dashboard
Daily Payments - Workers (LKR 1,700/Day)			
ID	NAME	DAYS WORKED	NET PAY
010	Wasantha Kumara	1.5 Days	LKR 2,550.00
Weekly Payments - Drivers (LKR 2,200/Day)			
ID	NAME	DAYS WORKED	NET PAY
001	Sunil Weerakkody	2.5 Days	LKR 5,500.00
005	Hasaranga Denuwan	0 Days	LKR 0.00
016	Dinesh Udayakumara	0.5 Days	LKR 1,100.00
Monthly Payments - Fixed Staff			
ID	NAME	ROLE	FIXED REGISTERED SALARY
004	Thushani Mallikaarchchi	Warehouse Assistant	LKR 30,000.00
015	Bimsara Wijesooriya	Manager	LKR 100,000.00

4.2.7 Attendance Logs Module

The attendance logs module allows the administrator to monitor employee attendance records.

The system displays check-in and check-out times for each employee. This feature helps the organization track employee work hours and maintain accurate records.

🕒 Daily Attendance Logs				
Employee ID	Full Name	Check-In Time	Check-Out Time	Status
001	Sunil Weerakkody	2026-03-16 15:05:42	Still In	
010	Wasantha Kumara	2026-03-16 14:59:27	Still In

4.2.8 Employee Directory Module

The Employee Directory module allows administrators to view and manage all registered employees within the system. This module provides a centralized view of employee information stored in the database, making it easier for administrators to monitor workforce details.

The information displayed in this module is retrieved from the employees table in the database. The system automatically loads all employee records and displays them in a structured table format for easy viewing.

This module also includes an option for administrators to add new employees to the system through the Employee Registration page. By maintaining an updated employee directory, the organization can efficiently manage employee records and ensure accurate payroll processing.

ID	Full Name	Designation	Basic Salary (LKR)	Joined Date
005	Hasaranga Denuwan	Driver	2,200.00	2026-03-16
001	Sunil Weerakkody	Driver	2,200.00	2026-03-16
004	Thushani Mallikaarchchi	Warehouse Assistant	30,000.00	2026-03-12
015	Bimsara Wijesooriya	Manager	100,000.00	2026-03-12
016	Dinesh Udayakumara	Driver	50,000.00	2026-02-27
010	Wasantha Kumara	Worker	20,000.00	2026-02-27

4.2.9 Admin Dashboard

The Admin Dashboard is the central interface used by the administrator to manage the Payroll and Leave Management System. After successfully logging into the system, the administrator is redirected to the dashboard, which provides a summary of important system information.

The dashboard displays key statistics and system activities that help administrators monitor employee management processes efficiently. These statistics are automatically retrieved from the database and updated dynamically.

The Admin Dashboard provides the following information:

- Total number of registered employees
- Number of pending leave requests
- Daily attendance records
- Recent attendance logs generated through the RFID system

This interface allows administrators to quickly access different system modules such as employee registration, leave management, payroll management, attendance logs, and employee directory.

4.4.3 Employee Directory

This report provides a list of all registered employees in the system along with their basic details. It helps administrators manage and review employee information efficiently.

Fields Included:

- Employee ID
- Full Name
- Role
- Basic Salary

Data Source: Employees Table

4.5 Chapter Summary

This chapter presented the design of the proposed system, including interface design, database structure, and report layouts. It explained how different system components such as user interfaces, data storage, and reports are organized to support system functionality. Overall, the solution design provides a clear blueprint for the development and implementation of the system.

CHAPTER 5 – TESTING

5.1 Introduction

System testing is an important phase in the software development process. It is carried out after the system has been developed in order to verify that all system components function correctly and meet the specified requirements.

The purpose of testing is to identify errors, verify system performance, and ensure that the developed system operates according to the expected functionality. Through testing, developers can confirm that the system produces correct outputs when valid inputs are provided and handles incorrect inputs appropriately.

5.2 Testing Approach

The testing approach used in this project involved verifying each module of the system individually and ensuring that the system performs as expected.

The following testing methods were applied:

Unit Testing

Unit testing was conducted to test individual components of the system separately. Each module such as login processing, employee registration, leave submission, and payroll calculation was tested independently.

Integration Testing

Integration testing was performed to ensure that different modules of the system work together properly. For example, the attendance module was integrated with the payroll module to calculate employee salaries automatically.

System Testing

System testing was carried out to evaluate the complete system to ensure that all functionalities work together correctly and produce accurate results.

5.3 Test Cases

Test Case 1 – Admin Login

Table 2- Test Case 1 – Admin Login

Field	Description
Test Case ID	TC01
Module	Login System
Description	Verify that the admin can log into the system using correct credentials
Input	Username: admin, Password: 1234
Expected Result	Admin dashboard should be displayed
Actual Result	Admin dashboard displayed successfully
Status	Pass

Test Case 2 – Employee Login

Table 3 - Test Case 2 – Employee Login

Field	Description
Test Case ID	TC02
Module	Login System
Description	Verify that employees can log into their portal
Input	Valid employee username and password
Expected Result	Employee dashboard should be displayed
Actual Result	Employee dashboard displayed

Status	Pass
---------------	------

Test Case 3 – Add Employee

Table 4 - Test Case 3 – Add Employee

Field	Description
Test Case ID	TC03
Module	Employee Registration
Description	Verify that admin can register a new employee
Input	Employee ID, Name, Role, Salary, RFID, Username, Password
Expected Result	Employee should be successfully registered
Actual Result	Employee added to database
Status	Pass

Test Case 4 – Leave Request Submission

Table 5 - Test Case 4 – Leave Request

Field	Description
Test Case ID	TC04
Module	Leave Management
Description	Verify that employees can submit leave requests
Input	Leave type, leave date, reason
Expected Result	Leave request saved with status “Pending”
Actual Result	Leave request recorded successfully
Status	Pass

Test Case 5 – Leave Approval

Table 6 - Test Case 5 – Leave Approval

Field	Description
Test Case ID	TC05

Module	Leave Management
Description	Verify that admin can approve leave requests
Input	Click approve button
Expected Result	Leave status updated to “Approved”
Actual Result	Status updated successfully
Status	Pass

Test Case 6 – Attendance Recording

Table 7 - Test Case 6-Attendance Recording

Field	Description
Test Case ID	TC06
Module	Attendance System
Description	Verify that RFID tap records employee attendance
Input	RFID tag scan
Expected Result	Check-in time recorded
Actual Result	Attendance stored successfully
Status	Pass

Test Case 7 – Payroll Generation

Table 8 -Test Case 7-Payroll Generation

Field	Description
Test Case ID	TC07
Module	Payroll System
Description	Verify that payroll is calculated correctly
Input	Attendance records
Expected Result	Salary calculated based on working days
Actual Result	Payroll report generated successfully
Status	Pass

CHAPTER 6- CONCLUSION

The objective of this project was to design and develop a Web-Based Payroll and Leave Management System with RFID Attendance for Saketha Enterprises. The system was developed to replace manual processes used for employee attendance tracking, leave management, and payroll calculations.

The implemented system successfully provides a centralized platform for managing employee information, recording attendance using RFID technology, processing leave requests, and generating payroll summaries.

By automating these processes, the system significantly reduces manual workload, minimizes calculation errors, and improves overall operational efficiency. Administrators are able to monitor employee activities in real time while employees benefit from a simple and convenient method to record attendance and request leave.

Despite the successful implementation of the system, there are some limitations. The system currently operates within a local environment and may require additional security measures and scalability improvements for large-scale deployment.

Future improvements may include integration with biometric fingerprint devices, mobile application support, advanced reporting features, and enhanced security mechanisms.

Overall, the developed system provides an effective solution for managing employee attendance, leave requests, and payroll operations within Saketha Enterprises.

Appendix B – Permission letter from Course Coordinator

11th December 2025

Dear Sir / Madam,

Requesting Permission for Data Gathering

The students mentioned below are currently following the Diploma in Business Information Systems -Full Time (DBIS-25.1F) program at the National Institute of Business Management (NIBM), Kandy Regional Centre.

We request your kind assistance to help them by giving them the necessary information required to submit their final course project.

The students' names and index numbers are follows:

Student Name	Index Number
Ms. H.R Wijerathna	KADBIS251F-010
Mr. S.K.M.M.P Ganegoda	KADBIS251F-014
Mr. W.M.A.O Wijesooriya	KADBIS251F-015
Mr. K.A.K.G Kalubowila	KADBIS251F-016

Thank You!

H.M.S.K.B. Herath
Course Director

Appendix C – Approval Letter of Organization

Date: 12th December 2025

To: Mr H.M.S.K.B Herath,
Course Director,
Diploma in Business Information Systems
NIBM Kandy Regional Centre

Subject: Granting Permission and Cooperation for Final Project Study

Dear Sir,

This letter confirms that we, Saketha Enterprises, have received and reviewed the request for permission (dated 11th December 2025) from the students of the Diploma in Business Information Systems (DBIS) at the National Institute of Business Management (NIBM).

We understand that the student group, comprising:

- Ms. H.R. Wijerathna
- Mr. S.K.M.M.P. Ganegoda
- Mr. W.M.A.O. Wijesooriya
- Mr. K.A.K.G. Kalubowila

is undertaking a final project titled: "Design and Implementation of an Inventory Management System "

We hereby grant permission to the student group to proceed with their project study within our organization. We will offer the necessary cooperation to facilitate their Requirement Analysis by allowing them to:

1. Conduct interviews with relevant staff members (Manager, Warehouse Assistant, etc.).
2. Observe our current inventory and sales operations.
3. Review samples of non-sensitive documents and data to understand the business flow.

We acknowledge the assurance that all information gathered will be treated with strict confidentiality and used solely for academic purposes.

We look forward to reviewing the final project proposal and the proposed system solution.

Thank you.

Sincerely,

W.M.K.J. Wijesooriya
Owner,
Saketha Enterprises
0714148610

Saketha Enterprises
345, Kaddawaththa,
Kurunegala
0714148610 / 0778458610

Appendix D – Interview Questions

1. How is employee attendance currently recorded?
2. How are employee leave requests handled?
3. How are employee salaries calculated?
4. What challenges do you face with the current system?
5. What improvements would you expect from a computerized system?

Appendix E – Saketha Enterprises Manual Attendance Signing Sheet

SAKETHA ENTERPRISES		
Date :- <u>20/01/2026</u>		
Name	Arrival	Leave
Bimsara Wijesooriya		
Sunil Weerakkody		
Dinesha Udayakumara		
Wasantha Kumara		
Hasaranga Denuwan		
Thushani Mallikarachchi		

Appendix F – Saketha Enterprises Manual Salary Calculation Spreadsheet

Salary Report - Month of January

Name	Working days	Daily Salary	Weekly Salary
Sumil Weerakkody	25	LKR 2,200.00	LKR 55,000.00
